Microcontrollers Programming Code is written for the microcontroller in an integrated developments environment, a PC program. The code is written in a programming language. (e.g. C, BASIC, or Assembly). The IDE debugs the code for errors, and then compiles it into binary code which the microcontroller can execute.

### Introduction to microcontrollers tutorial - Getting started

Introduction to Microcontrollers – Programming the PIC16F84A. Having known about the architecture of the PIC16F84A, let's dive into learning how to actually program the controller. As you all know (If you have read the post about getting started with PIC16F84A) the port B pins RB6 and RB7 along with the MCLR pin will be used to program the controller (To quote again, RB6 is pin 12, RB7 is pin 13 and MCLR is pin 4 of the microcontroller).
