Pyroclastic rocks (derived from the Greek: , meaning fire; and , meaning broken) are clastic rocks composed of rock fragments produced by explosive volcanism and erupted as individual particles. The individual rock fragments are known as pyroclasts. Pyroclastic rocks are a type of volcanoclastic deposit. Phreatic pyroclastic deposits are a variety of pyroclastic rock that ...

Pyroclastic rock - Wikipedia

Pyroclastic rocks or pyroclastics (derived from the Template:Lang-el, meaning fire; and Template:Lang, meaning broken) are clastic rocks composed solely or primarily of volcanic materials. Where the volcanic material has been transported and reworked through mechanical action, such as by wind or water, these rocks are termed volcanoclastic .

Pyroclastic rock | Britannica

A pyroclastic rock is a type of rock composed of compacted fragments of volcanic materials. Often the result of an explosive volcanic eruption, pyroclastic rocks can be giant or quite small, and may amalgamate with non-volcanic rocks as they travel.

What Is a Pyroclastic Rock? (with pictures)

Pyroclastic flow, a fluidized mixture of hot rock fragments, gases, and entrapped air that moves at high speed in thick, dark, turbulent clouds that hug the ground during a volcanic eruption. Gas temperatures can reach 600 to 700 ° C (1,100 to 1,300 ° F), and the flow ' s velocity can exceed 100 km (60 miles) per hour.

pyroclastic. [p r -kl s t k] Composed chiefly of rock fragments of explosive origin, especially those associated with explosive volcanic eruptions. Volcanic ash, obsidian, and pumice are examples of pyroclastic materials.

Pyroclastic | Definition of Pyroclastic at Dictionary.com

Pyroclastic rocks are found throughout the Skye Centre, ranging from material which is unequivocally intrusive, to deposits which were clearly laid down under subaerial and subaqueous conditions (see Chapters 3, 4 and 6). Historically, there has been a tendency to link spatially-associated pyroclastic rocks and intrusive units.

A pyroclastic surge, also referred as a dilute pyroclastic density current, is a flowing mixture of gas and rock fragments ejected during some volcanic eruptions. Pyroclastic surge refers to a specific type of pyroclastic current which moves on the ground as a turbulent flow with low particle concentration (high ratio of gas to rock) with support mainly from the gas phase.

Volcanic rocks are extrusive igneous rocks. There are two main groups: rocks that form from the solidification of lava flows (extrusive), and rocks that form from the compaction of solid volcanic fragments (pyroclastic). This post will cover the basics in easy-to-grasp bullet-point style that facilitates comparison between volcanic rocks.
