The Timoshenko-Ehrenfest beam theory was developed by Stephen Timoshenko and Paul Ehrenfest early in the 20th century. The model takes into account shear deformation and rotational bending effects, making it suitable for describing the behaviour of thick beams, sandwich composite beams, or beams subject to high-frequency excitation when the wavelength approaches the thickness of the beam. The resulting equation is of 4th order but, unlike Euler-Bernoulli beam theory, there is also a second ...

The solution is independent of the thickness t and the Poisson's ratio ν . The stress in the plug is approximately halve the value that would occur in a completely restrained plug. Alternative Answer to Problem 3d (displacement method) When we substitute (1) and (2) in (4) we find $u = \frac{a}{EI} \frac{t^3}{12} (1 + \nu) = \frac{a}{EI} \frac{t^3}{12} (1 + \nu)$.

, , , , , yields the exact solutions for the fields of displacements and stresses according to the theory of elasticity, which in general differ from the Bernoulli–Euler theory. The exact fields do coincide with the conventionally obtained solutions listed in Sections 18-23 of the book by Timoshenko and Goodier (1982) , and in Chapter II, §10 of Szabó (1985) .
